

Amphibians at Fort Pickett

The three pictures above (eggs, hatching eggs, & larvae) represent the life phases of the spotted salamander, *Ambystoma maculatum*. The adult is pictured in the center of the poster.

Life History

The name amphibian means “**double life**”, and is given to members of this group for the double life that they lead. Most adult amphibians usually live on land, however, their soft eggs must be laid in the water. Young amphibians called “**larvae**” spend their early years in the water, breathing through gills in the side of their head in much the same way as fish do. In many ways they resemble fish more than they resemble their parents, for at first, they have no legs, and swim by wriggling their tail. As they mature, amphibians will usually lose their gills and develop legs.

Most amphibians have soft skin which easily absorbs water. This puts them in very close contact with their surroundings. It also makes them particularly susceptible to certain man-made toxins and pollutants. This may be why the number of amphibian species, and the size of many amphibian populations, has been declining in recent years. Amphibians, are excellent indicators of environmental health and may be among the first organisms to suffer from the effects of global pollution and climate change thus providing an early warning of environmental degradation.

Size can be deceiving. The Northern cricket frog, *Acris crepitans* (above and right) is one of the smallest frogs on Fort Pickett, as demonstrated by the full grown adult on the biologist's finger.

Spotted Salamander *Ambystoma maculatum*

Cryptic coloration, also known as camouflage, allows an organism to match its background and hence become less vulnerable to predation or recognition by prey. The Northern cricket frog, *Acris crepitans* displays such coloration. The brown phase is pictured above and the green phase below left.

The Pickerel frog, *Rana palustris* (above) and the American toad, *Bufo americanus* (left) are two commonly encountered Anurans on Fort Pickett.

List of all amphibian species documented on ARNG-MTC Fort Pickett.

Scientific Name	Common Name
Salamanders	
<i>Notophthalmus v. viridescens</i>	Newt, red-spotted
<i>Necturus punctatus</i>	Waterdog, dwarf
<i>Ambystoma maculatum</i>	Salamander, spotted
<i>Ambystoma opacum</i>	Salamander, marbled
<i>Desmognathus fuscus</i>	Salamander, northern dusky
<i>Eurycea bislineata cirrigera</i>	Salamander, southern two-lined
<i>Eurycea guttolineata</i>	Salamander, three-lined
<i>Hemidactylium scutatum</i>	Salamander, four-toed
<i>Plethodon glutinosus</i> *	Salamander, slimy
<i>Plethodon chlorobryonis</i> *	Salamander, Atlantic Coast slimy
<i>Pseudotriton r. ruber</i>	Salamander, northern red
Frogs & Toads	
<i>Bufo americanus</i>	Toad, American
<i>Bufo fowleri</i>	Toad, Fowler's
<i>Acris c. crepitans</i>	Frog, eastern cricket (northern)
<i>Hyla chrysoscelis</i>	Treefrog, Cope's gray
<i>Hyla versicolor</i>	Treefrog, gray
<i>Pseudacris c. crucifer</i>	Peeper, northern spring
<i>Pseudacris f. feriarum</i>	Frog, southeastern chorus
<i>Rana catesbeiana</i>	Bullfrog
<i>Rana clamitans melanota</i>	Frog, northern green
<i>Rana palustris</i>	Frog, pickerel
<i>Rana sphenoccephala</i>	Frog, southern leopard
<i>Gastrophryne carolinensis</i>	Toad, eastern narrow-mouthed

Virginia Tech and Fort Pickett biologists surveying for aquatic and terrestrial amphibians at Fort Pickett.
